                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell

SUBUNIT: Homotrimer (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein. Also exists extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by proteolytic processing (Bv similarity)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3 QRETPEGAEAKPWY

                                                                                                                       Submitted (SEP 1991) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Cytokine that binds to TNFRSFIA/TWFR1 and TNFRSFIB/TNFRE. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.
-!- SUBGINIT: Homotrimer (By similarity).
-!- SUBCELLULAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
-!- PTM: The soluble form derives from the membrane form by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-FEB-1994 (Rel. 28, Created)

                                       Immunol. Immunopathol. 82:183-192(2001).

FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell
   proliferation and induce cell differentiation
SUBUNIT: Homotrimer (By similarity).
SUBCELLULAR LOCATION: Type II membrane proteir

ALSO EXISTS AS EXTRACELLULAR SOLUBLE FORM (BY SIMILARITY).

PTM: THE SOLUBLE FORM DERIVES FROM THE MEMBRANE FORM BY PROTEDLYTIC PROCESSING (BY SIMILARITY).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the membrane form occurs by binding to soluble TNFRSF1A/TNFR1 (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBGNIT: Homotrimer (By similarity).

                                                                                                                    J. Physiol. 273:L524-L530(1997). FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and TNFRSFIB/TNFBR. It is mainly secreted by macrophages induce cell death of certain tumor cell lines. It is
                         pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RETPEGAEAKPWY

It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY
